Transcriptional fidelity enhances cancer cell line selection in pediatric cancers

Cuyler Luck, Kat Yu, Ross A Okimoto, Marina Sirota

11/1/21

Characterization of Cancer Cell Lines

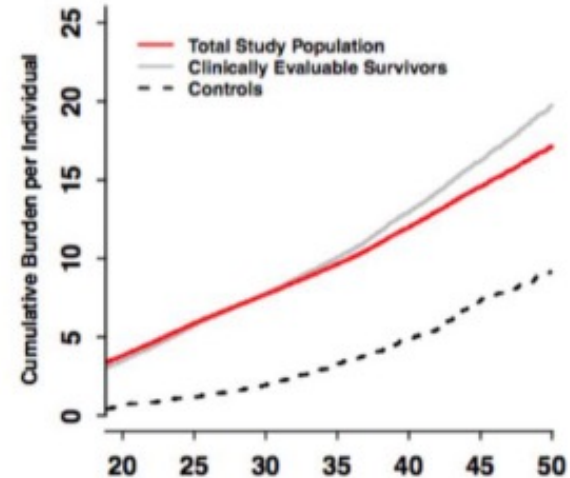

Current Outlook of Childhood Cancers

Chase Center
Seats 18,604

>11,000 est. 2021 cases, >1,200 est. 2021 deaths
among children & adolescents
~86% 5-year relative survival all cancers, children/adolescents

Siegel et al. *CA CANCER J CLIN* 2021

Chronic health conditions (low and high grade) ~2x higher than community controls

Bhakta et al. *The Lancet* 2017

doi: <https://doi.org/10.1101/2021.10.01.462682>

Data Overview

12,747 tumor samples

912 cell lines

All RNA-seq processed with Toil
pipeline

age_at_dx <= 18 →

Use CCLE annotations
file for cell line disease
information

1,655 tumor samples
spanning 12 tumor types

799 cell lines spanning 29
TCGA codes

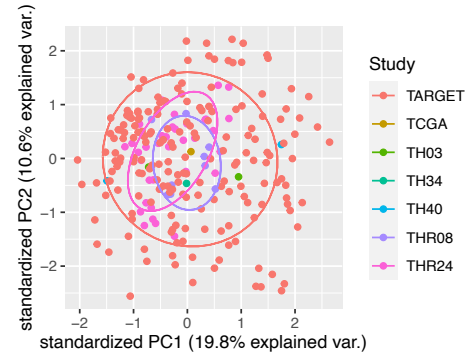

Integrate data for
correlation analysis

Data Analysis

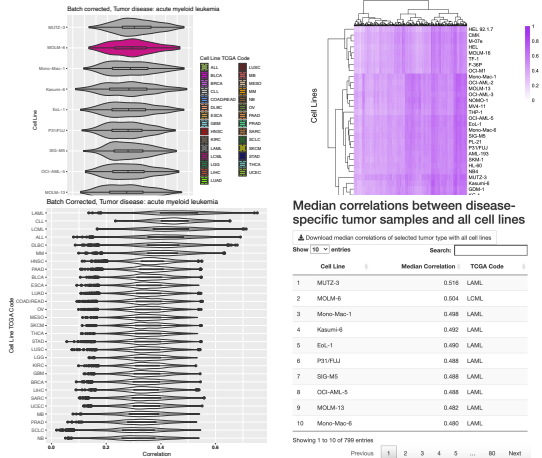

Acute myeloid leukemia

ComBat
batch = study of origin

Acute myeloid leukemia

Calculate Spearman
correlation coefficients

Cell line expression
data

Merge with cell
line data

Case Study: Ewing Sarcoma

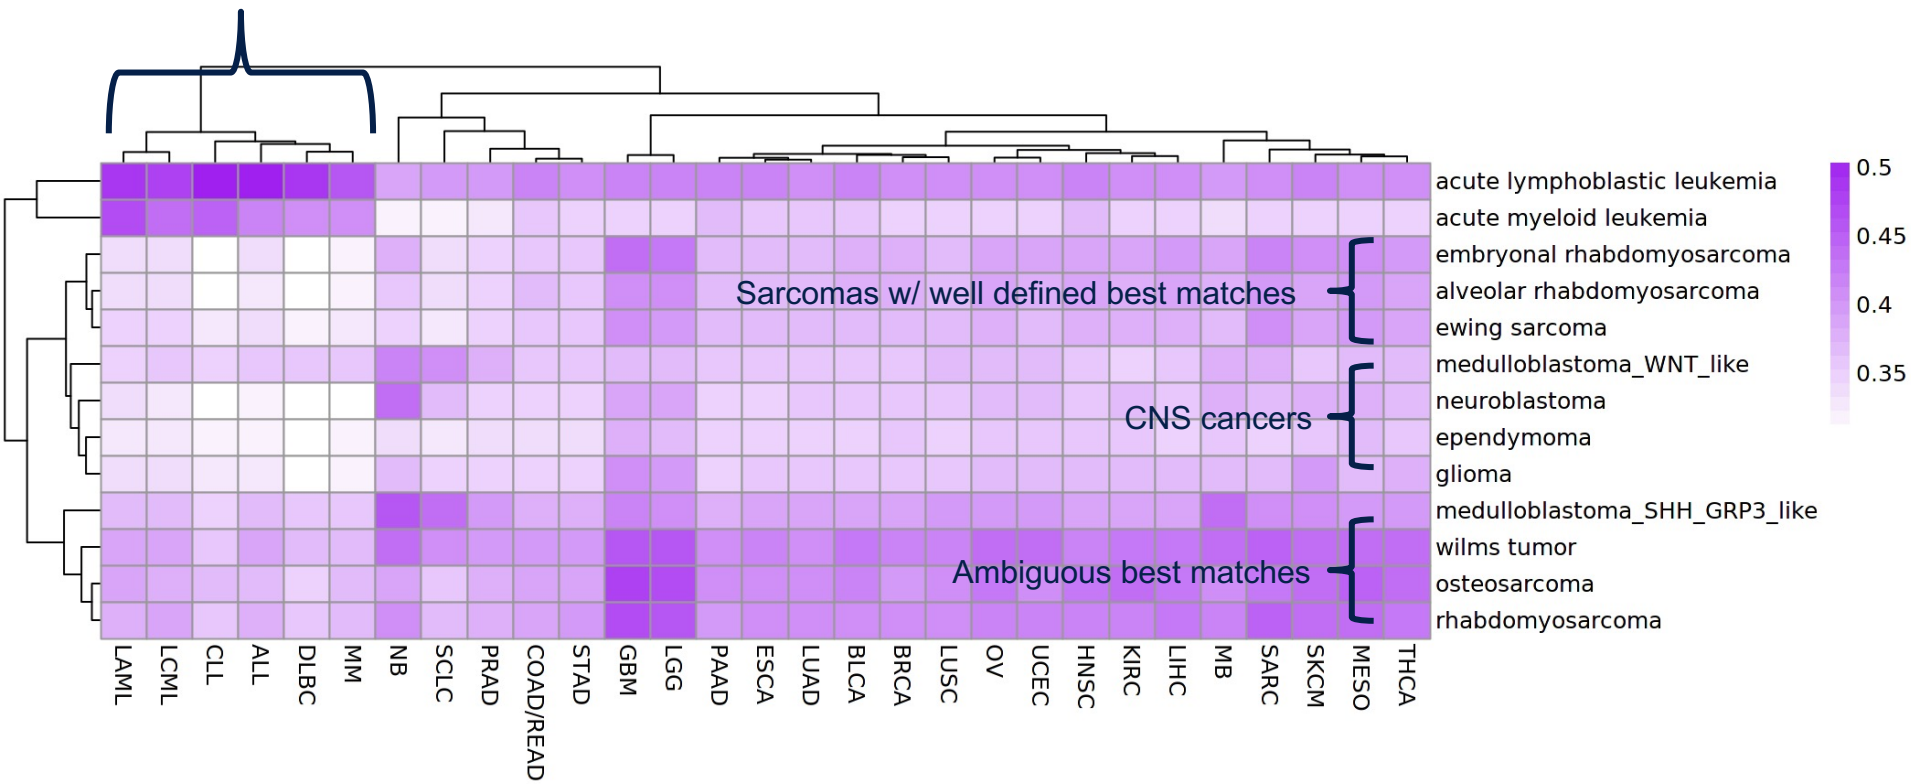

Case Study: Ewing Sarcoma

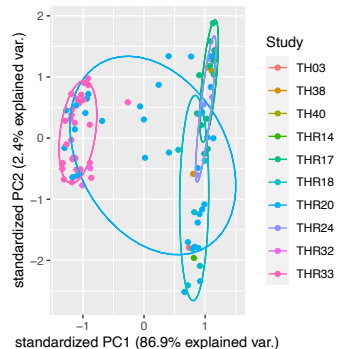

Global Overview

Blood cancers

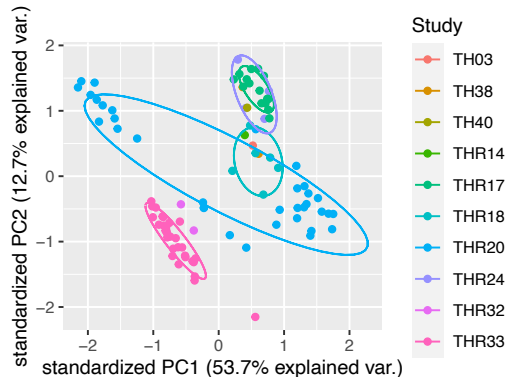

Medulloblastoma data – bad or interesting?

TPM

ComBat
batch = study of origin

Expected counts

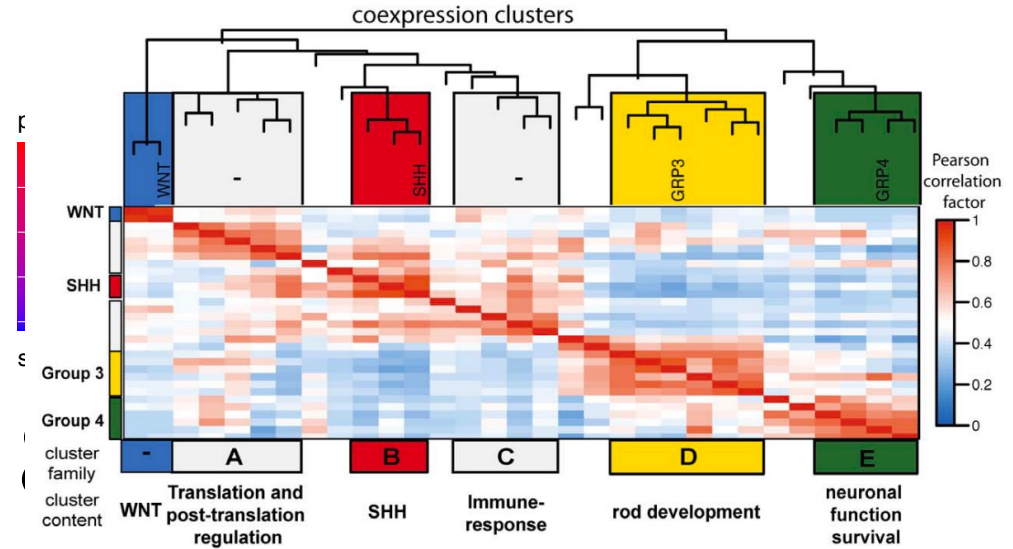

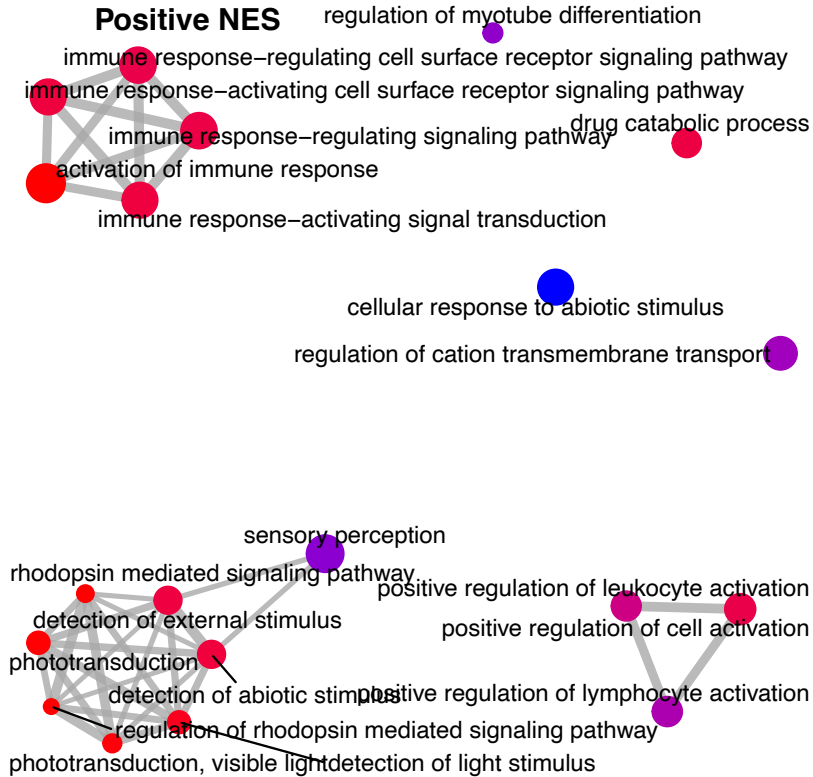

K-means
K=2

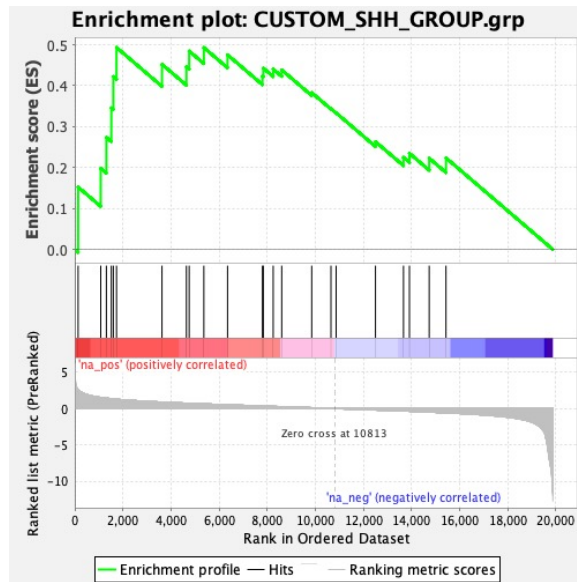

edgeR
DGE Analysis

Inference of MB molecular subtypes

Hooper et al. *PLoS ONE* 2014

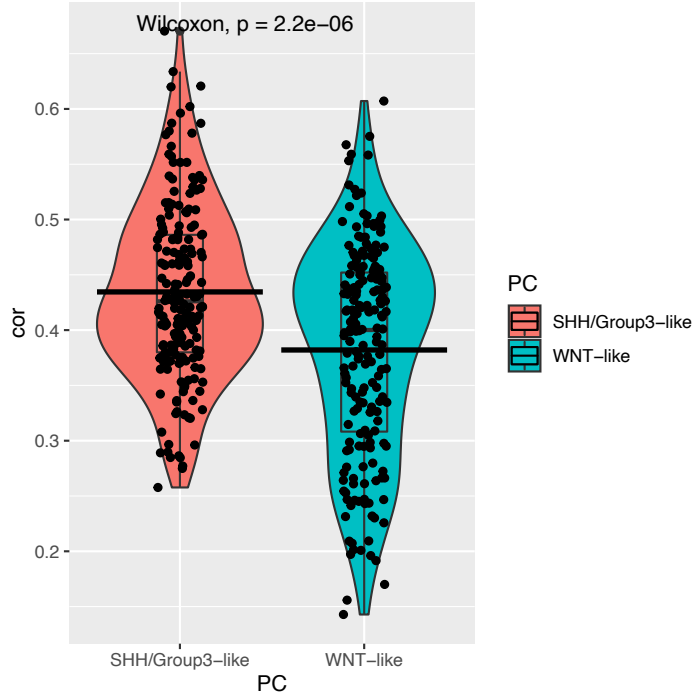

WNT, SHH, and Group 3 MB gene expression signatures are enriched in DGE groups

Group 4: no significant enrichment

Impact of MB subtype on correlations with MB lines

All Wilcoxon FDR $p < 0.05$

Conclusions

- Created an interactive public resource to guide cell line selection for pediatric cancer researchers
 - <https://pecanexplorer.org>
- Showed that molecular subtype can influence representation by cell lines
 - We add to the call for more WNT/Group 4 MB cell lines

Thank you!
